

Heavi Energy — Design Partner Pilot Agreement

Pilot Duration: 90 days **Pilot Cost:** Free **Parties:** Heavi Energy and _____ ("Design Partner")

Purpose

A time-boxed, no-cost pilot to evaluate whether Heavi's solar site-suitability platform saves the Design Partner time in early-stage parcel screening, and to measure the platform's **precision** against the Partner's own expert judgment. The pilot is structured so both sides know, at day 90, whether continued use is worth a paid subscription.

What Heavi Provides

- **Scoring of up to 200 candidate parcels** through the solar suitability platform, against 14 criteria drawn from 15 federal and open data sources, with per-NERC-region calibrated weights.
- **Per-parcel PDF assessment** with score, confidence tier, per-criterion breakdown naming the data source used for each criterion, and full methodology documentation.
- **Batch results** with map visualization and a ranked, color-coded list (High / Moderate / Low / Excluded), exportable as a portfolio PDF.
- **Interconnection context** from the LBNL "Queued Up" 2025 queue dataset: nearest substation, existing connected capacity within 50 km, and nearby active solar queue activity (informational, not a power-flow study).
- **Weekly check-in calls** to capture feedback and answer methodology questions.
- **The methodology whitepaper** as a citable reference for the Partner's internal or investment-committee use.

What the Design Partner Provides

- **50–200 candidate parcels** currently in their screening pipeline (coordinates or addresses; any funnel stage).
- **Expert review of Heavi's top-scored parcels** — classifying each High-scored parcel as **would-pursue**, **would-not-pursue**, or **already-known**, with a brief reason for any "would not pursue" (see the Precision Metric Framework).
- **Feedback** on: which criteria matter most to their decisions, what is missing, and what would make them pay.
- **A 30-minute call at days 30, 60, and 90.**

Success Criteria (defined jointly, up front)

Metric	Definition	Target
Precision	$(\text{would-pursue} + \text{already-known}) \div \text{High-scored parcels}$	$\geq 70\%$
Coverage	$\text{Partner-selected parcels Heavi also scores High} \div \text{partner-selected parcels}$	$\geq 80\%$
Value	Partner reports time savings vs. their current screening workflow	Qualitative, captured at day 90

Precision and coverage are defined precisely in the companion **Precision Metric Framework**. Both are measured on the Partner's own parcels, so the results reflect the Partner's geography and segment — not a generic benchmark.

Pilot Timeline

Day	Milestone
0	Kickoff: Partner delivers parcel list; success criteria confirmed
1–7	Heavi scores all parcels; delivers batch results, map, and per-parcel PDFs
30	Review call: walk through results; Partner begins expert review of High-scored parcels
60	Review call: precision and coverage computed; failure reasons logged
90	Closeout call: final metrics, value assessment, and conversion discussion

Data Handling

- Parcel coordinates and the Partner's classifications are used solely to operate the pilot and compute the agreed metrics.
- Heavi will not publish the Partner's parcel list, pipeline, or identity without written consent. Aggregate, anonymized precision results may inform Heavi's product development.
- The Partner retains all rights to its parcel data and pipeline information.

Conversion Discussion

At day 90, both parties review the measured precision, coverage, and time-savings value, and discuss an **annual subscription** for continued scoring access:

- Annual subscription: \$25,000–\$50,000 / year** (unlimited scoring), scoped to the Partner's expected volume and modules (solar today; hazard and trade-area as they ship).
- No obligation: a pilot that does not meet the success criteria carries no commitment, and the failure-reason log is delivered either way as a standalone deliverable.
