

HEAVI ENERGY

Solar Site Screening for Renewable Development

What it does

Score candidate parcels against **15 federal and open data sources** with documented, peer-reviewed methodology, **confidence scoring**, and **interconnection context** — so you know both the answer and how much to trust it.

How it works

Upload parcels (CSV or enter addresses) → automated scoring against **14 criteria** (9 scored, 5 exclusion) → **ranked results on a map** → **PDF export** with full methodology documentation. Geocoding, batch portfolios, and per-parcel assessments included.

What makes it different

Every assessment tells you the **score AND how much to trust it** — which data sources were used, where the gaps are, and the peer-reviewed methodology backing each criterion. It is **deterministic**: identical inputs always produce identical outputs, so every assessment is auditable and reproducible — unlike AI answer engines.

Validated

- **71% of real EIA solar installations score High** across 10 US states (greenfield-eligible).
- **Positive discrimination in all 10 of 10 states** — real installations outscore matched random rural land everywhere.
- Weights **calibrated per NERC region against 6,321 EIA Form 860 installations**, producing seven region-specific profiles.
- Interconnection context from **LBNL "Queued Up" 2025** (4,426 active solar projects).

Full methodology and validation are published in the Heavi Solar Methodology Whitepaper.

Pricing

- **Design partner pilot:** Free for 90 days (up to 200 parcels), with weekly check-ins and a jointly-defined success bar ($\geq 70\%$ precision, $\geq 80\%$ coverage).
- **Annual subscription:** \$25,000–\$50,000 / year (unlimited scoring).
